Current result, or an older output?

Report refresh: 13:00

100%

Saved input: 2 completed

Third parcel arrived

12:20

Late arrival

Same rule. Different input states.

Saved input: 12:05

2 / 2 = 100%

Both arrivals on time

Current records

2 / 3 = 66.7%

Third arrival was late

The 13:00 refresh read the older output.

The next run failed before publication

R1230 failed

Injected write-permission fault

No new output published

What did readers actually see?

Old output

66.7% reached the report.

Recovery and logic are separate checks

Recovery

Did the report read the new output?

Correct logic

Does the code follow the definition?

Keep what explains the earlier report

Explain what readers saw

Output + refresh

Earlier 100% report

Reproduce the calculation

Input + code

Retained data and execution

Compare the map and recovery table

Map: earlier evidence

Refresh → output → run

Page: recovery table

New output + matching refresh

Try it on the page

Published and read

Find both records before claiming recovery.
